

Static Hyperlinks

If you insert an ordinary hyperlink in a template, then it will appear unchanged in the finished document.

This is a normal static link: <https://www.google.com>

It links to Google in both the template and the finished document.

Dynamic Hyperlinks

Regular Hyperlinks

A hyperlink field starts with <<link: or <<link_ followed by a URL.

This link field is set dynamically by the data "URL1": <https://www.amazon.com>

Display Text

Display text may be used instead of showing the target URL. To use display text, the data may include the text and then the URL, separated by a pipe symbol (|).

In JSON format, the data for this looks like:

```
"URL2": "eBay|https://www.ebay.com"
```

In this case the text "eBay" will display in the final document, and clicking this text will take you to <https://www.ebay.com>.

This link field is set by "URL2", with alternative display text: [eBay](https://www.ebay.com)

Email Hyperlinks

Mailto: links are also supported. The field format is exactly the same, only the data is changed.

This is an example mailto link set by "URL3": example@example.com

You may choose to use display text for a mailto link in order to hide the mailto part as follows:

```
"URL3": "example@example.com|mailto:example@example.com"
```
